1.

Consider a directed graph with distinct and nonnegative edge lengths and a source vertex s . Fix a destination vertex t , and assume that the graph contains at least one s - t path. Which of the following statements are true? [Check all that apply.]

The shortest (i.e., minimum-length) s - t path might have as many as $n - 1$ edges, where n is the number of vertices.

Correct Response

There is a shortest s - t path with no repeated vertices (i.e., a "simple" or "loopless" such path).

Correct Response

The shortest s - t path must include the minimum-length edge of G .

Correct Response

The shortest s - t path must exclude the maximum-length edge of G .

Correct Response

points

2.

Consider a directed graph $G = (V, E)$ and a source vertex s with the following properties: edges that leave the source vertex s have arbitrary (possibly negative) lengths; all other edge lengths are nonnegative; and there are no edges from any other vertex to the source s . Does Dijkstra's shortest-path algorithm correctly compute shortest-path distances (from s) in this graph?

Never

Only if we add the assumption that G contains no directed cycles with negative total weight.

Always

Maybe, maybe not (depends on the graph)

Incorrect Response

points

3.

Suppose you implement the functionality of a priority queue using a *sorted* array (e.g., from biggest to smallest). What is the worst-case running time of Insert and Extract-Min, respectively? (Assume that you have a large enough array to accommodate the Insertions that you face.)

- ☐ $\Theta(n)$ and $\Theta(n)$
- ☐ $\Theta(1)$ and $\Theta(n)$
- ☐ $\Theta(\log n)$ and $\Theta(1)$
- ☒ $\Theta(n)$ and $\Theta(1)$

Correct Response

points

4.

Suppose you implement the functionality of a priority queue using an *unsorted* array. What is the worst-case running time of Insert and Extract-Min, respectively? (Assume that you have a large enough array to accommodate the Insertions that you face.)

- ☐ $\Theta(n)$ and $\Theta(n)$
- ☐ $\Theta(n)$ and $\Theta(1)$
- ☒ $\Theta(1)$ and $\Theta(n)$

Correct Response

- ☐ $\Theta(1)$ and $\Theta(\log n)$

5.

You are given a heap with n elements that supports Insert and Extract-Min. Which of the following tasks can you achieve in $O(\log n)$ time?

- ☐ None of these.
- ☒ Find the fifth-smallest element stored in the heap.

Correct Response

- ☐ Find the median of the elements stored in the heap.
 - ☐ Find the largest element stored in the heap.
